The rapid introduction of sophisticated computers, services, telecommunications systems, and manufacturing systems has caused a major shift in the way people use and work with technology. It is not surprising that computer-aided modeling has emerged as a promising method for ensuring products meet the requirements of the consumer. The Handbook of Digital Human Modeling provides comprehensive coverage of the theory, tools, and methods to effectively achieve this objective. The 56 chapters in this book, written by 113 contributing authorities from Canada, China, France, Germany, the Netherlands, Poland, Sweden, Taiwan, UK, and the US, provide a wealth of international knowledge and guidelines. They cover applications in advanced manufacturing, aerospace, automotive, data visualization and simulation, defense and military systems, design for impaired mobility, healthcare and medicine, information systems, and product design. The text elucidates tools to help evaluate product and work design while reducing the need for physical prototyping. Additional software and demonstration materials on the CRC Press web site include a never-before-released 220-page step-by-step UGS-Siemens JackTM help manual developed at Purdue University. The current gap between capability to correctly predict outcomes and set expectation for new and existing products and processes affects human-system performance, market acceptance, product safety, and satisfaction at work. The handbook provides the fundamental concepts and tools for digital human modeling and simulation with a focus on its foundations in human factors and ergonomics. The tools identified and made available in this handbook help reduce the need for physical prototyping. They enable engineers to quantify acceptability and risk in design in terms of the human factors and ergonomics.

This volume constitutes the refereed proceedings of the International Conferences, FGCN and DCA 2012, held as part of the Future Generation Information Technology Conference, FGIT 2012, Kangwondo, Korea, in December 2012. The papers presented were carefully reviewed and selected from numerous submissions and focus on the various aspects of future generation communication and networking, and digital contents and applications.

Spanning the nineteenth to twenty-first centuries, this book investigates how home is imagined, staged and experienced in western culture. Questions about meanings of ' home ' and domestic culture are triggered by dramatic changes in values and ideals about the dwellings we live in and the dwellings we desire or dread. Deborah Chambers explores how home is idealised as a middle-class haven, managed as an investment, and signified as a status symbol and expression of personal identity. She addresses a range of public, state, commercial, popular and expert discourses about ' home ' : the heritage industry, design, exhibitions, television, social media, home mobilities and migration, smart technologies and ecological sustainability. Drawing on cross-disciplinary research including cultural history and cultural geography, the book offers a distinctive media and cultural studies approach supported by original, historically informed case studies on interior and domestic design; exhibitions of model homes; TV home interiors; ' media home ' imaginaries; multiscreen homes; corporate visions of ' homes of tomorrow ' and digital smart homes. A comprehensive and engaging study, this book is ideal for students and researchers of cultural studies, cultural history, media and communication studies, as well as sociology, gender studies, cultural geography and design studies.

In Language and Learning in the Digital Age, linguist James Paul Gee and educator Elisabeth Hayes deal with the forces unleashed by today ' s digital media, forces that are transforming language and learning for good and ill. They argue that the role of oral language is almost always entirely misunderstood in debates about digital media. Like the earlier inventions of writing and print, digital media actually power up or enhance the powers of oral language. Gee and Hayes deal, as well, with current digital transformations of language and literacy in the context of a growing crisis in traditional schooling in developed countries. With the advent of new forms of digital media, children are increasingly drawn towards video games, social media, and alternative ways of learning. Gee and Hayes explore the way in which these alternative methods of learning can be a force for a paradigm change in schooling. This is an engaging, accessible read both for undergraduate and graduate students and for scholars in language, linguistics, education, media and communication studies.

This book is about Drosophila retrotransposons, which were the first eukaryotic mobile DNA elements discovered at the molecular level. Both passive and active inhabitants of the eukaryotic genome, they can influence its stable components and at the same time be subject to various types of cellular control. The book covers different aspects of their structure and expression, replication and transpositions, their interaction with the host cell, their role as important factors of genetic instability and essential contributors to the structure and evolution of the Drosophila genome.
