The principles of differential protection you MUST understand (on photo: SIPROTEC protection relays) Figure 1 shows a simple differential protection scheme, also known as a Merz-Price scheme. In this simple scheme, we can assume that under normal operating conditions, the current entering into the piece of equipment under protection is equal (or in the case of a transformer, proportional) to its exiting current.

"The differential protection is 100% selective and therefore only responds to faults within its protected zone. The boundary of the protected zone is uniquely defined by the location of the current transformers. Time grading with other protection systems is therefore not required, allowing for tripping without additional delay.
