Visitor pattern allows us to create a separate visitor concrete class for each type of operation and to separate this operation

In object-oriented programming and software engineering, the visitor design pattern is a way of separating an algorithm from an object structure on which

Not knowing the runtime type

assumption of the Visitor

the visitor pattern in two ways. The first one is that it's a trick to do multiple dispatch in a single-dispatch language. The other is that it's a way to do abstract data types in OOP languages.

Visitor design pattern is one of the behavioral design patterns. It is used when we have to perform an operation

on a group of similar kind of Objects. With the help of visitor pattern, we can move the operational logic from the objects to another class. The visitor pattern consists of two parts:

State. The state pattern is used to alter the behaviour of an object as its internal state changes. The pattern

Object-oriented programming (OOP) is a programming paradigm based on the concept of "objects", which can contain data and code:

data in the form of fields (often known as attributes or properties), and code, in the form of procedures (often known as methods).. A feature of objects is that an object's own procedures can access and often modify

Encapsulation. An object is an hermetic capsule. It contains its own data and is responsible for their consistency. In this context, we abolish the global variables. The goal
