As a chemical term, "sugar" usually refers to all carbohydrates of the general formula C_n(H₂O)_n. Sucrose is a disaccharide, or double sugar, being composed of one molecule of glucose linked to one molecule of fructose. Because one molecule of water (H₂O) is lost in the condensation reaction linking glucose to fructose, sucrose is represented by the formula C₁₂H₂₂O₁₁ (following the general formula C_n[H₂O]_{n-1}).

"The Organic Chemistry of Sugars provides excellent coverage of traditional and contemporary methods to manipulate, use, and exploit sugar molecules. With the availability of this monograph, the knowledge base of modern carbohydrate chemistry will be considerably richer for the practitioners of this time-revered and venerable branch of organic chemistry."

Simple sugars have the molecular formula C_Xn(H_X2_O)_Xn, where n is at least 3. They also have to be capable of forming an aldehyde or ketone carbonyl group. For example, in glucose the cyclic forms predominate, but there is an isomer with a carbonyl group.

Each chapter contains numerous examples demonstrating the methods and strategies that apply mainstream organic chemistry to the chemical modification of sugars. The book first describes the discovery, development, and impact of carbohydrates, followed by a discussion of protecting group strategies, glycosylation techniques, and oligosaccharide syntheses.

It consists of a molecule of D-galactose and a molecule of D-glucose bonded by beta-1-4 glycosidic linkage. A carbohydrate (*/k??rbo??ha?dre?t /*) is a biomolecule consisting of carbon (C), hydrogen (H) and oxygen (O) atoms, usually with a hydrogen–oxygen atom ratio of 2:1 (as in water) and thus with the empirical formula Cm(H2O)n (where m may be different from n).

Stereochemistry, a subdiscipline of chemistry, involves the study of the relative spatial arrangement of atoms that form the structure of molecules and their manipulation. The study of stereochemistry focuses on stereoisomers, which by definition have the same molecular formula and sequence of bonded atoms (constitution), but differ in the three-dimensional orientations of their atoms in space.

Caramel (*/ ? k æ r ? m ? 1 / or / ? k ??r m ? 1 /*) is a medium to dark-orange confectionery product made by heating a variety of sugars.It can be used as a flavoring in puddings and desserts, as a filling in bonbons, or as a topping for ice cream and custard.. The process of caramelization consists of heating sugar slowly to around 170 °C (340 °F). As the sugar heats, the molecules ...
