The musculocutaneous nerve, which breaks off proximally from the others, is located in the flexor compartment, either between the biceps and coracobrachialis or within the body of the coracobrachialis. For complete anesthesia of the forearm, the musculocutaneous nerve should be included in the block.

Even though it was difficult to directly visualize the axillary nerve, the block was easy to perform with easily recognizable ultrasonographic landmarks. Block duration was approximately 120 min. Conclusions: We describe a new ultrasound-guided technique to specifically block the axillary nerve. The potential clinical role of this new block remains to be determined.

The interscalene blocks works like a charm for most of these abscesses. However, the interscalene block has significant potential complications including paralysis of the diaphragm. While a technically very easy block, you need to know what you are doing and be prepared to avoid nerve injury, toxicity and other potential harms from the procedure. Selective block of the axillary nerve avoids many of the risks associated with

□ Ultrasound guided axillary block is a safe, reliable block of the brachial plexus. □ Place the transducer transversely across the axilla, approximately at the junction of biceps brachii and the pectoralis muscles. □ Use the axillary artery as a landmark: median, ulnar and radial nerves usually lie at 11, 2 and 5-6 o'clock respectively.

Emergency physician performed ultrasound-guided regional anesthesia is an evolving field that offers many potential benefits in the emergency setting: Analgesia can be targeted specifically to the region of pain and provide relief for many hours, large volumes of local anesthetic can be avoided and there is also less need for general sedation without the increased morbidity to patients.

### Ultrasound Guided Nerve Block - Overview

Studies have determined the minimum effective local anaesthetic volume for postoperative shoulder analgesia to be as little as 0.9 ml with ultrasound when compared with 5.4 ml with nerve stimulation. 3 We routinely use 8-10 ml of ropivacaine 2 mg ml<sup>-1</sup> when using the block for

Ultrasound-guided axillary nerve blocks are used for local anesthesia of the arm as an alternative to general anesthesia. Ultrasound imaging is used to find the target nerves and the surrounding blood vessels. Local anesthetics are administered using a needle, which is usually visualized in the ultrasound image plane.
