Water Oscillation In An Open water will be more than the actual mass enclosed in the tube because there will be an interaction between the oscillation and the water outside the open end. The predicted equation for the determination of the end correction of the water oscillation in a cylindrical tube can be derived as follows.

A water tank with height, 0.815m, was filled with water. A transparent tube, open at both ends, was put into the water. To clearly observe the motion of the water level, a small piece of styrofoam was put into the tube to float on the water surface. The tube was held up vertically so that only 1/4 of its total length was under the water.
